

**Intervention Level 1**

2014

**Nutritional Status of Children under Six- A Micro Analysis  
in Hamdard Nagar ICDS Project**

This report is one among the series of reports being published by Matri Sudha from time to time on the basis of both primary and secondary data to reflect maternal and child health situation in Delhi. The data from the present report has been reviewed and analyzed the state of malnutrition in one of the ICDS projects in Delhi. Hamdard Nagar ICDS Project falls in South District. The sample has been collected from 3 bastis of Lal Kuan, on Mehrauli Badarpur Road which is having 22anganwadi centres. During the whole process children below 6 years covered by 5 anganwadi centre were taken for the analysis.

The findings were based on the standard pattern adopted and practiced by anganwadis across the country on the basis of weight for age WHO standard.

This is the *Intervention Report-1* on the basis of data collected and analyzed for seeking actions from Government Departments and Matri Sudha in order to work toward minimizing the prevalence of malnutrition through multiple interventions in urban slums of Delhi.

We would also like to acknowledge the contribution of NikhitaGurung, Masters of Social Work Student, Amity University and SadhnaKad, Research Scholar, Jawahar Lal Nehru University in analyzing and documenting this report. Special thanks to Surender Singh, Arvind Singh, Nazmeen, Pinki and Sapna from Matri Sudha.

Matri Sudha  
(15.11. 2014)

Ensuring that children develop to their full potential requires interventions at early stages of life. As this is crucial not only for individual health, physical development, but also for cognitive and socio-emotional development

---

### ***Executive Summary***

Yes, malnutrition is one of the serious concerns for being once of biggest constraints in ensuring the early development of a child but more than that it becomes critical when there are key differences in policies documents to reduce malnutrition and its actual implementation.

In the present study, “*Nutritional Status of Children Below Six Years- A Micro Analysis in Hamdard Nagar ICDS Project*” whose objectives are to 1) monitor the growth of children till 5 years of age; 2) status of identification and documenting the profile of each malnourished child in growth monitoring charts at anganwadi centre; 3) to know the referral procedure undertaken by anganwadi workers; 4) coordination between grass-root workers like ASHAs, ANMs and Anganwadi workers; 5) level of community participation

The growth monitoring process and nutrition surveillance are two important activities where the weight for age growth cards is kept for all children below six years. Growth monitoring primarily helps in identifying malnourished children by observing any form of growth deviation and also to identify diseases and conditions that are apparent through stunted growth.

Over a period of two months we monitored the growth of children from three areas- Nardan Basti, Prem Nagar and NT/DNT families. Out of 348 children covered during growth monitoring process (169 male/179 female) 145 children were found malnourished (64 male/81 female) which is around 42 percent of the whole population covered during the growth monitoring processes. 20 percent were found severely malnourished and 22 percent were moderately malnourished and rest 58 was found children in normal category.

### ***Need for Assessment***

As per the last four year reports of Ministry of Women and Child Development, 49.9 percent children were malnourished in March 2011; 47.7 percent in March 2012; 38.18 percent children in 2013; and 30.85 percent children in March 2014. The figures are quite impressive when one sees reduction in prevalence of malnutrition in Delhi, however, in absence of any clarity the kind of interventions done in Delhi to reduce the malnutrition we prompted to do this micro-analysis. Secondly, the data in itself is limited in nature as it does not provide gender-wise information related to malnutrition, which we have captured in our findings. Thirdly, lack of coordination between department of health and family welfare and women and child development in providing convergent services to reduce malnutrition is being captured in this analysis; fourthly, anganwadi workers lack basic understanding on filling the growth monitoring charts and maintain multiple registers/copies to record the birth weight

However, while the ICDS program is envisioned to reduce the prevalence of child malnutrition and to reach to the severely malnourished child, there is a mismatch between the program's

intention and its actual implementation. The key mismatches we found during the collection of data from community, personal interviews and group discussion-

- Older children between 3-6 years participate much more than younger ones but lack pre-school activity
- The program fails to preferentially target girls
- The parents of malnourished children are not reached with counseling on better feeding and child care practices
- Grass root convergence and coordination between health and women and child development is weakest and the most challenging
- Anganwadi workers are lesser trained on usage of growth monitoring charts
- Community participation is lacking and follow-up with families is absent

### **Scope of Study**

This micro analysis will help us to understand the status of health and nutrition of children below six particularly the girl child, coordination between frontline workers to improve the condition of a malnourished child, working of anganwadi centres, issues with anganwadi workers in respect to growth monitoring charts, reporting, referral and follow-up in three bastis of Hamdard Nagar ICDS Project. Similar analysis can be done in other areas of Delhi in order to come up the status health and nutrition of children below six in Delhi.

### ***The Context- Area Profile***

The location for the study was located along the Mehrauli Badarpur Road, where Nardan basti, Prem Nagar and NT/DNT families lives on either side of the road which falls under Hamdard Nagar ICDS Project.

### **Area Profile**

#### **Nardan Basti**

Nardan basti has about 600 households and a population of over 3-4 thousand people where most of the men are daily wage workers, some drivers, auto rickshaw drivers etc. and majority of the women stay at home and fulfill their role as housewives, cooking, cleaning and looking after the children. The Integrated Children Development Scheme is a unique programme that works for early childhood development. In Nardan Basti there are 3 Anganwadi centers and is also covered by a Primary Health Center which is operational.

#### ***Prem Nagar***

Prem Nagar has about 500 households and populations of over 5000 people where majority of people work as daily wage Labour, others are working as drivers, sweepers, carpenters, welders, mechanic etc. On the other hand majority of women are illiterate and stay at home, however few women work as daily wage Labour or cooks and maids in the nearby areas. Under the Integrated Children Development Scheme there are 2 Anganwadi centres and is covered by a Primary health centre which are operational in the area.

### ***Nomadic and De-notified tribes***

Around 90 families reside in the NT/DNT area opposite the Lal Kuan and Prem Nagar Basti area on the Mehrauli Badarpur road for the past four years after being shifted from Kalkaji Depot during Commonwealth games. The households are segregated into Kabari basti, Lohar basti and Sapera basti mostly consisting of Hindus and Muslims. Most communities are involved in making tombstones, collecting waste while perform street circus acts with snakes, and langoors. Some still follow caste based occupation and are traditional blacksmiths who are skilled at making sickles, spade, axe scissors etc. Some men are mostly occupied in gambling also. There is one community toilet that is not maintained so well so, the people defecate in the open also or use the bushes. Their nearest primary health care center and Anganwadi center is in Prem Nagar Basti. Drinking water and water for daily usage is mostly purchased from water tankers coming at regular intervals. The houses are connected with light through the illegal electricity connections. The houses are kaccha and are covered with plastic sheets and bamboos. *It is to be noted that there is no services of anganwadis for children of these families despite there is provision of extension of ICDS services.*

### ***Methodology***

A total of 152 children in Nardan Basti, 71 children in NT/DNT and 125 children below six years of age were enumerated for the growth monitoring process. We divided the whole population in three categories i.e. from birth to 1 year, 1 to 3 year and 3-5 year (male/female separately). The data was collected using the growth monitoring process using face to face interview method with the family especially the mothers.

Area	Male	Female	Total
Nardan Basti	77	75	152
NT/DNT	32	39	71
Prem Nagar	60	65	125
<b>Total</b>	<b>169</b>	<b>179</b>	<b>348</b>

We use the same technique as use in anganwadi centres and also one of the recommended processes WHO i.e. “weight for age” anthropometric approach/ method. The process is being assessed for monitoring children growth ranging till 5 years of age by using two types of weighing scales which is also being used by us during the whole process. The weighing scales are as follows-

- Baby Weighing Scale
- Adult weighing scale

(Anthropometric method also includes two other methods using Mid-upper arm circumference and height measurement).

The primary data was cross verified on the field to avoid duplication and over/under assessment of the basic findings. The collected data then entered and analyzed using Microsoft Excel specifying area-wise findings and analysis.

## Area-wise findings

### For NT/DNT

Normal (Green)			Moderate Acute Malnutrition (Yellow)			Severe Acute Malnutrition (Red)		
Male	Female	Total	Male	Female	Total	Male	Female	Total
18	24	42	9	10	19	5	5	10

We can see from the given chart that out of the total children covered during the growth monitoring in NT/DNT families 20 children were between births to 1 year of age. Out of these 20 children 5 children were found malnourished. Surprisingly, out of 5 malnourished children 4 were girls.

Between the age group of 1-3 year there were 27 children in these families. Out of 27 children, 14 children were found malnourished which is around 52 percent of total population in these age groups children. However, same number of boys and girls were found malnourished in this age group.

Out of 24 children in the age group of 3-5 year 10 children were malnourished.

### For Nardan Basti

Normal (Green)			Moderate Acute Malnutrition (Yellow)			Severe Acute Malnutrition (Red)		
Male	Female	Total	Male	Female	Total	Male	Female	Total
43	33	76	23	18	41	11	24	35

In Nardan Basti out of 152 children 76 were found malnourished during the growth monitoring processes. It was highly surprising to see that there was deviation in 50 percent children from standard. Out of 76 severely malnourished children, 42 were girls and rest 34 was boys, hence,

again the percentage of girls found malnourished were more than boys in Nardan Basti too.

Having been looked by the age-wise data, we found that out of 29 children between birth to 1 year, 5 children were found malnourished, however, as soon as the age goes up, malnutrition also goes up subsequently. Between the age group of 1-3 year, out of 79 children, 44 children were found malnourished, in which 17 girls and 4 boys were found severely malnourished. (Kindly refer the chart).

There were 44 children in the age-group of 3-5 year in which 61 percent children were found malnourished.

### For Prem Nagar

Normal (Green)			Moderate Acute Malnutrition (Yellow)			Severe Acute Malnutrition (Red)		
Male	Female	Total	Male	Female	Total	Male	Female	Total
44	41	85	6	11	17	10	13	23

In Prem Nagar, 125 children were covered under growth monitoring process in which we found that, 40 children were below than their standard weight as per their age. In Prem Nagar too, the situation is similar to Nardan Basti, where the malnutrition among children increases with the age. Between birth to 1 year 2 children were found malnourished (severely malnourished). However, the proportion increases among the children who fall in the age-group of 1-3 year and 3-5 year, with 21 children and 17 children respectively. Second similar situation is the higher numbers of girls were found malnourished in comparison to boys.

### Major Concerns during the Analysis

Three areas taken up for the study are quite different from each other. In other words Nardan Basti and Prem Nagar are a little developed as compared to the NT/DNT area. Even the people of Nardan and Prem Nagar are much more aware and developed as compared to the people of NT/DNT. Thus the challenges also varied from area to area.

### Nardan Basti and Prem Nagar

- Most parents were proactive in the growth monitoring process, informing the mobilizers about the location of any baby between 0 to 5 years nearby their vicinity

- Case of underreporting, most of the data did not match to that given noted down/ shared by the Anganwadi worker. On asking the parents if AWW took any the Growth monitoring initiative it was revealed that AWW did not take any such kind of initiative
- The malnourished children are not being linked with nearest primary health centre despite the availability of ASHA workers in the intervention areas
- Many children were found born as low-birth weight babies requiring immediate attention and intervention which was found missing
- Follow-up with families whose growth were monitored by anganwadi worker was found missing as no Anganwadi and ASHA worker reach to them
- For ASHA workers working with malnourished children is a secondary work despite having a different section for maintaining such records from the field in their diary
- Even the kind of intervention with children who were on records of anganwadi as malnourished was absent and remain mere as monthly progress report
- Despite receiving new growth monitoring charts many of them found unfilled by anganwadi workers
- Anganwadi workers share their concern related to growth monitoring chart as they are not efficiently trained

#### **NT/DNT**

- NT/DNT consists of a high risk population excluded from the ICDS scheme (no anganwadi center at the time of collecting the data) from where malnourishment cases is expected from them due to their lack of proper resource of nutritious food and safe drinking water, but upon analysis it is seen that Nardan Basti shows a higher number of malnourished cases than NT/DNT despite having 3 operational Anganwadi centers in Nardan Basti and 2 in Prem Nagar
- It was seen that the some people in the NT/DNT area did not have much idea about Public distribution scheme through ration cards and importance of health cards but all of them had voter's ID card
- One of the major causes of malnutrition is that it's a vicious circle that starts from mother itself, who are themselves, malnourished and anemic and women from such NT/DNT community do not rely on institutional delivery due to their lack of trust on government services and medicines

#### **Conclusion**

This is the first intervention report in which we analyzed the status of malnutrition among children below six years in the respective areas (Nardan Basti, Prem Nagar and NT/DNT families) which falls under Hamdard Nagar ICDS Project. The objective is to reduce the prevalence of malnutrition among children below six through community based prevention which includes timely growth monitoring, health and nutrition counseling, linking children with health centres, follow-up, encouraging breastfeeding practices, completing immunization process, reporting severely malnutrition and early intervention etc. Since these are the activities done through ICDS system and coordinated through NRHM process (now NUHM for urban areas) necessary interventions are sought through the system to reduce the prevalence of malnutrition through multiple interventions.

## Annexure-1

### NT/DNT Families

Total No. of Children tracked for Growth Monitoring as per weight for age standard in NT/DNT families

Total number of children found as Severe Acute Malnourished, Moderate Acute Malnourished and Normal as per weight for age standard (age group Birth to 5 Year)

Total No. of Children in age group of Birth to 1 year found as Normal, Moderate Acute Malnourished and Severe Acute Malnourished

Total No. of Children in age group of 1-3 year found as Normal, Moderate Acute Malnourished and Severe Acute Malnourished

Total No. of Children in age group of 3-5 year found as Normal, Moderate Acute Malnourished and Severe Acute Malnourished

### Nardan Basti

Total No. of Children tracked for Growth Monitoring in Nardan Bastias per weight for age standard

Total number of children found as Severe Acute Malnourished, Moderate Acute Malnourished and Normal as per weight for age standard (age group Birth to 5 Year)

Total No. of Children in age group of Birth to 1 year found as Severe Acute Malnourished, Moderate Acute Malnourished and Normal as per weight for age standard

Total No. of Children in age group of 1 to 3 year found as Severe Acute Malnourished, Moderate Acute Malnourished and Normal as per weight for age standard

Total No. of Children in age group of 3 to 5 year found as Severe Acute Malnourished, Moderate Acute Malnourished and Normal as per weight for age standard

## PREM NAGAR

Total No. of Children tracked for Growth Monitoring in Prem Nagar as per weight for age standard

Total No. of Children found in Normal, Moderate Acute Malnutrition and Severe Acute Malnutrition Category as per weight for age standard (Birth to 5 Year)

Total No. of Children in age group of Birth to 1 year found as Severe Acute Malnourished, Moderate Acute Malnourished and Normal as per weight for age standard

Total No. of Children in age group of 1-3 year found as Severe Acute Malnourished, Moderate Acute Malnourished and Normal as per weight for age standard

Total No. of Children in age group of 3-5 year found as Severe Acute Malnourished, Moderate Acute Malnourished and Normal as per weight for age standard

## Children covered during growth monitoring process in Nardan Basti- September 2014

S.no	Name	Sex	Date of Birth	Mother's Name	Father's Name	Address	September 2014			
							Date	Age in months	Weight	Grade
